TRANSPORTATION COMMITTEE
December 7, 2021

SUBJECT: **2021 State of the Streets Report**

RECOMMENDATION: **Review the "2021 State of the Streets Report."**

STAFF CONTACT: Scott Spence, City Manager
Scott Egger, Director of Public Works
Roger Schoessel, City Engineer
Aubrey Collier, Design & Construction Manager
Brian Petrin, Civil Engineer

ORIGINATED BY: Public Works Department

ATTACHMENTS: 1. "2021 State of the Streets Report"

FISCAL NOTE: None.

PRIOR REVIEW: The Transportation Committee was briefed on the Transportation Benefit District "2020 Annual Report" on June 1, 2021. The Committee is typically provided with an update on the current "State of the Streets Report" each year.

BACKGROUND:

City staff evaluates the pavement conditions of the City's streets annually. Each segment of roadway is visually checked for defects and a rating score from 0 to 100 is assigned based on the type, severity, and extent of the defects found present.

The current (2021) data indicates that 97.2% of Lacey's roads are in very good or good condition, 2.6% are in fair condition, and 0.2% are in poor condition. The overall score for the road network has increased from 82.7 to 83.3.

ADVANTAGES:

1. The report provides a current and historical condition assessment of City roads.

2. The report allows the City to efficiently plan maintenance and rehabilitation for roadway projects.

DISADVANTAGES:

1. None.

PURPOSE / BACKGROUND ----- ----- ---- ---- ----

Every year the City of Lacey collects pavement condition data for its entire roadway network. Here's a summary of Lacey's streets:

- 33.9 centerline miles of arterial streets,
- 24.1 centerline miles of collector streets, and
- 120.6 centerline miles of residential (local) streets, for a total of
- 178.6 centerline miles of roadway within City limits.

All public roads are visually inspected for pavement surface defects. These defects are documented and tallied in the pavement management database. The purpose of this report is to put the raw data in a form that allows the City to determine the current status of these streets on a network level, as well as make intelligent pavement-related repair and funding decisions.

Having a pavement management program in place provides a valuable opportunity to evaluate pavement condition trends. By studying these trends we can estimate and propose future budgetary and maintenance requirements, prioritize projects to maximize cost-effectiveness, and evaluate past performance. This report includes several "what-if" scenarios generated by the pavement management software, which analyze how varying budget amounts will impact the City's roads over a period of time.

2021 ANNEXATION ----- ----- ---- ---- ----

The City of Lacey passed three ordinances which added roadway to the existing network in 2021 (See Figures 1-3 on the next page). 6.29 centerline miles of roadway in total were annexed, accounting for a 3.7% increase to the existing network. See the chart below for a detailed breakdown of quantities, PCI, and RSL values for the added roadways sorted by neighborhood. Refer to Pages 4-5 for more information regarding PCI and RSL scores.

2021 ANNEXED STREETS

	Neighborhood/Road Description	Centerline Miles	Lane Miles	Sections Added/ Modified	PCI (weighted by area)	RSL (weighted by area)
Ord. 1580	Arterial Street (Carpenter)	0.06	0.26	1[1]	**89**	23.9
Ord. 1589	Bicentennial	1.19	2.38	10	**84.8**	28.9

PAVEMENT MANAGEMENT SYSTEM ----- ---- ---- ----

Phase I (Field Data Collection)

Every year all paved roads within City limits are visually inspected for various signs of defects and aging (see pages 97-103). These roads are divided into smaller, more manageable sections for the purpose of inspection. Sections are typically from intersection to intersection and approximately 1000-1500 feet long as easily identifiable intersections allow. Currently the roadway network is divided up into 1139 field inspection units. As each section is examined, all pavement defects, along with their measurements and severities, are documented.

Phase II (Data Analysis & Scoring)

Since 2005 Lacey has been using a software program called *StreetSaver*, which was developed by the Metropolitan Transportation Commission (MTC) in the San Francisco Bay area and is specifically targeted for use by local municipalities. As data is gathered for each section, any defects noted are entered into the *StreetSaver* program, which deducts points from the section based on the defect type, severity, and size. That value is then adjusted to account for the number of different defects present within that section. This adjusted score is the pavement condition index (PCI). PCI scores range from 0 to 100; a score of 100 would denote a perfect, new section of roadway, and values getting close to 0 would represent a completely failed section.

After calculating the PCI scores for all road sections, the software establishes the extent of repair required and estimates repair costs. *StreetSaver* also calculates projected PCI scores based on different budgeting scenarios. Each year's rating and maintenance information is stored in a database, giving us a more complete record of our network's condition, and keeping track of the extent and timing of road improvements.

Phase III (Project & Treatment Selections)

The output from the data analysis includes a prioritized rating of the roadway segments. The list allows the City to develop a strategy for project selection depending upon the budgeting resources available. Another factor is the optimal timing for a given road treatment, which will ideally provide the greatest improvement in benefit for the lowest cost ("most bang for the buck"), thus making the best use of limited funds. A properly maintained pavement management system will aid in the challenge of maintaining the desired level of service on "good" roads while repairing the "poor" ones.

Pavement Condition Index (PCI) Scores

The condition categories listed below are ranges in the PCI scale that compare similar sections of pavement and make generalized assumptions about their condition.

- **"VERY GOOD"** (PCI Scores of 85 to 100)
  These streets may be relatively new. They have few, if any defects, and what defects they do have are likely cosmetic. Routine maintenance, such as crack sealing or a surface seal, may be enough to provide a smooth ride for many years to come.

- **"GOOD"** (PCI Scores of 60 to 84)
  These are streets that are beginning to show their age, due to climate and traffic. Common defects include various forms of cracking and raveling. The defects are generally not serious in nature, but could indicate a need for additional maintenance or localized treatment, such as patching. Their base is still intact and can provide several more years of service.

- **"FAIR"** (PCI Scores 40 of to 59)
  Defects, such as alligator cracking and depressions, have become more prevalent and more severe. Pavement edges may start to ravel away. These roads are functional, but require rehabilitation if they are to remain an asset in the future. Some structural deficiencies and surface roughness are evident.

- **"POOR"** (PCI Scores of 0 to 39)
  In this category, the pavement is overshadowed by large areas of cracking and depressions. The surfaces are uneven and may be prone to rutting. Failures in both the pavement and subgrade are easy to identify. These sections are near the end of their services lives and usually require a complete road reconstruction.

Remaining Service Life (RSL)

Some of the essential functions of pavement management are to (1) keep track of pavement condition using ways to measure performance and (2) forecast future pavement performance in order to plan ahead for maintenance and rehabilitation. One of the main indicators for the above is assessing the remaining service life (RSL) of a pavement.

Pavement RSL is the estimated number of years that a pavement section adequately performs to a desired level of service, after which time the pavement is providing substandard service quality. This value is calculated using the distress data and the pavement's rate of deterioration.

RSL is a measure of the amount of pavement service life, not pavement life. Therefore, it's possible for a road section to have an RSL value of zero, which means that it has dropped below the threshold of the desired level of service.

Functional Classifications

Roadways are grouped into functional classes based on the kind of service they are expected to provide. Transportation planners use functional classification to design a safe and efficient flow of traffic throughout the street network. The most basic categories are arterials, collectors, and residential streets.

- **ARTERIAL STREETS**
  This system of streets serves the major centers of urban activity and supports the highest traffic volumes. Its purpose is to move people and goods efficiently and quickly, with the highest level of access control.

- **COLLECTOR STREETS**
  These streets collect traffic from residential (local) roads and connect them with arterials. Compared to arterial streets, collectors provide a level of service at a lower speed for shorter distances, maintaining a balance between mobility and access.

- **RESIDENTIAL STREETS**
  The great majority of streets in the network are meant to provide the most access to residences and other properties but with a lower level of mobility. These generally interconnect with each other and to collector streets.

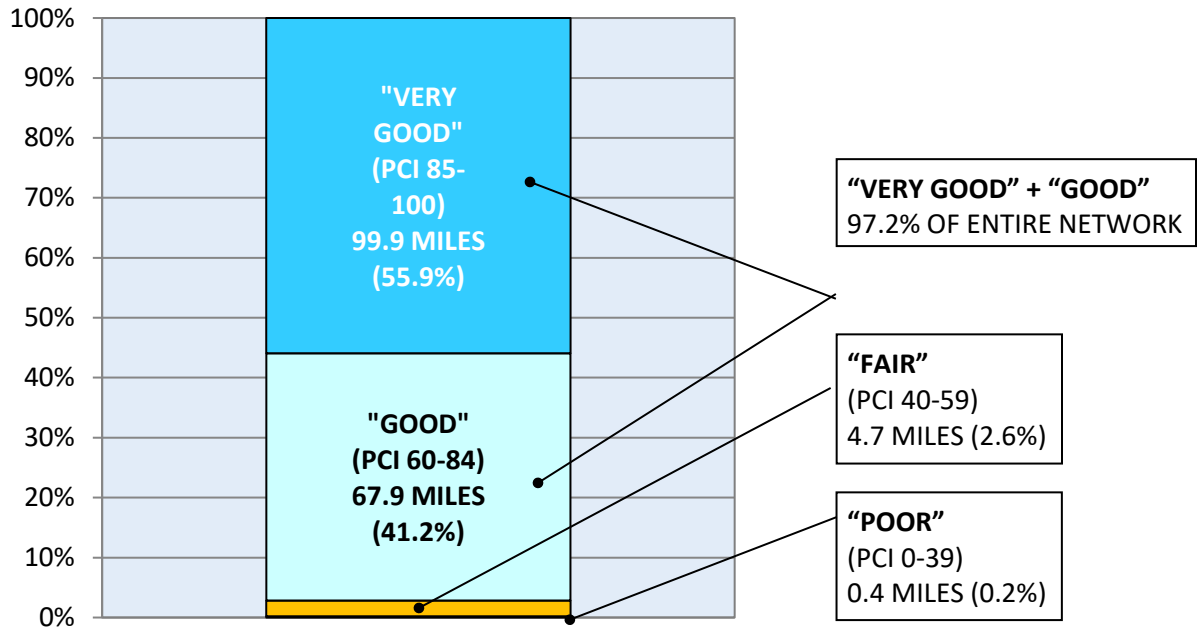
CURRENT PAVEMENT CONDITIONS ----- ---- ---- ----

The City of Lacey currently maintains 178.6 centerline miles of asphalt pavement. The average PCI score for the entire street network is 83.3. The table below summarizes the lengths and PCI scores of the road network, as a whole and by functional class. The numbers in parenthesis represent the change from the previous year.

Network Summary Statistics

	Centerline Miles	Lane Miles	Management Sections	Network %	PCI (weighted by area)	RSL (weighted by area)
Arterial Streets	33.9 (+2.2)	116.9 (+8.1)	156 (+7)	19.0% (+0.1)	**81.5 (+1.3)**	21.7 (+0.2)
Collector Streets	24.1 +(0.9)	54.8 (+2.1)	113 (+2)	13.5% (-0.2)	**83.1 (+1.5)**	19.5 (+0.1)
Residential Streets	120.6 (+7.2)	241.0 (+14.1)	870 (+42)	67.5% (+0.1)	**84.3 (+0.3)**	30.1 (+0.5)
Entire Network	178.6 (+10.3)	412.6 (+24.2)	1139 (+51)	100.0%	**83.3 (+0.6)**	26.4 (+0.5)

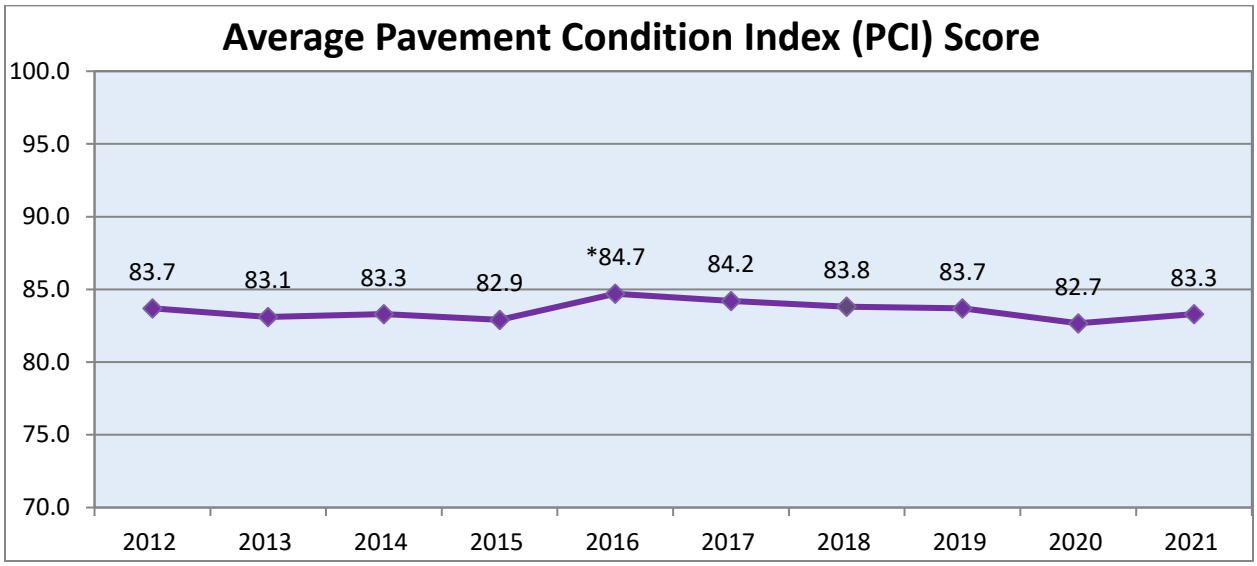
Over 97.2% of all streets in Lacey were rated as being in “good” or “very good” condition. Condition categories are relatively unchanged since last year.



Centerline Miles of Roadway per Condition Category

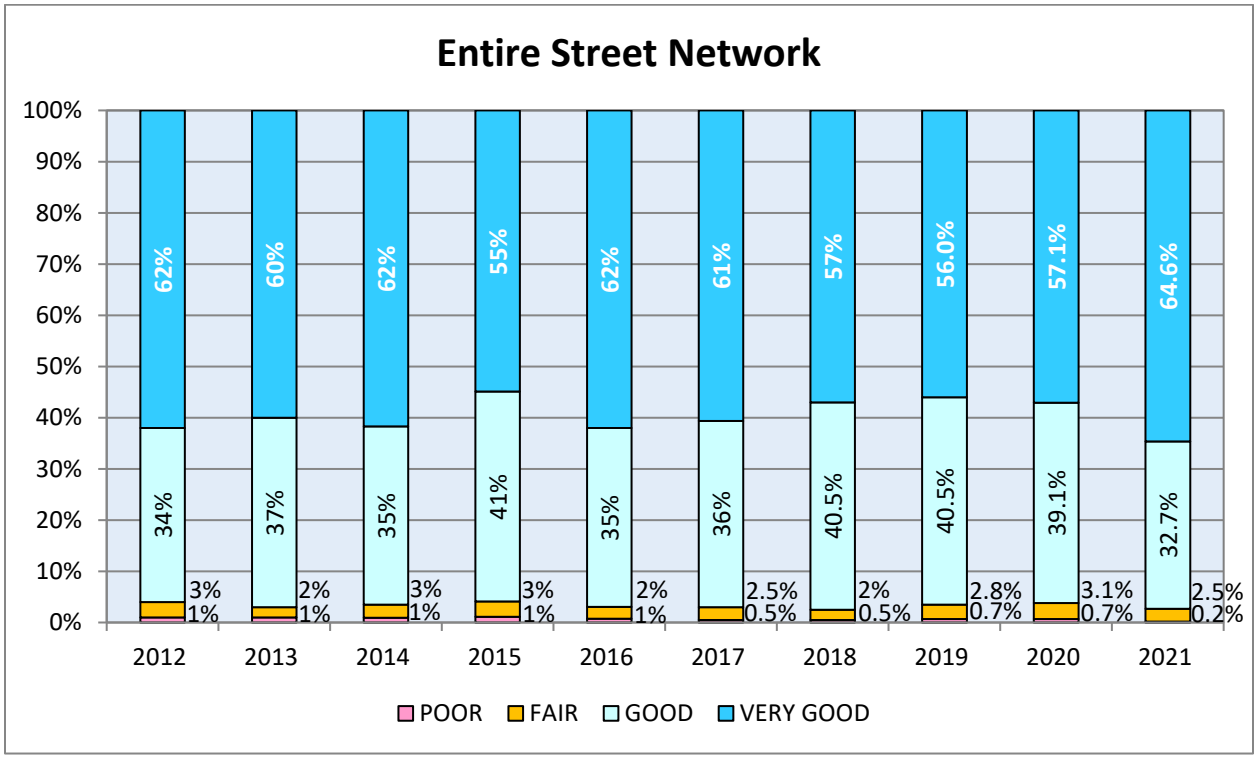
Return to Agenda

NETWORK TRENDS

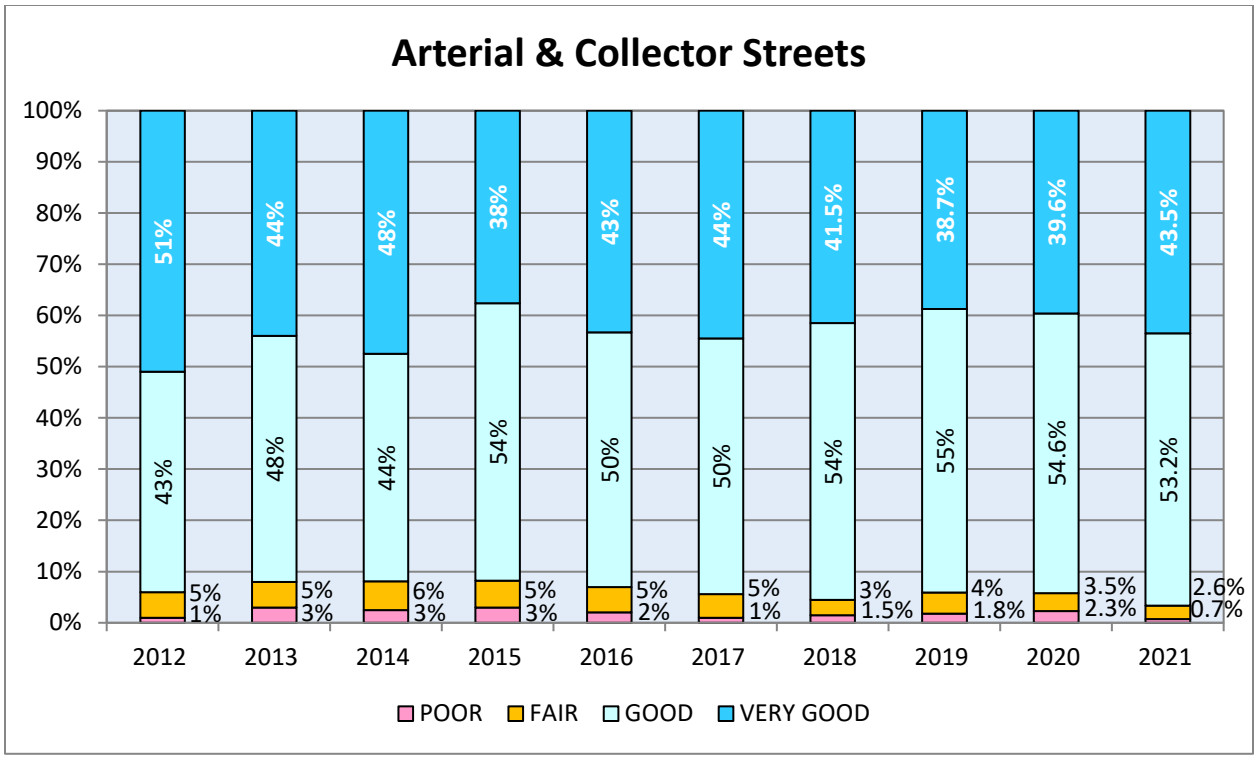


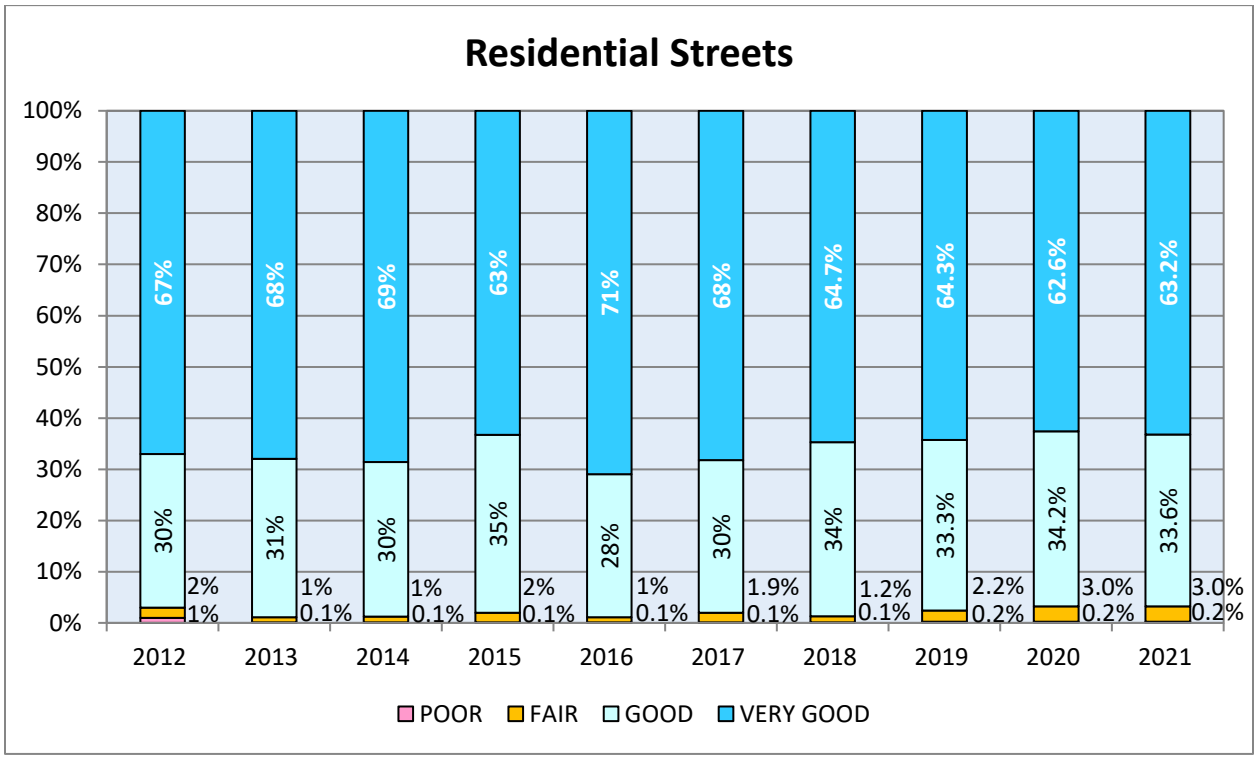
*Increase in PCI due to software update and revised definition of weathering and raveling.

The network Pavement Condition Index (PCI) score is determined from a weighted average based on section area. Recent neighborhood development (new streets), along with a history of road improvement projects, have helped to slow down the rate of pavement deterioration over the entire network.



Return to Agenda





PAVEMENT PRESERVATION STRATEGIES ----- ---- ---- ----

One of the key goals of pavement preservation is to prevent "very good" or "good" pavement from deteriorating. For roads with PCI scores in the 50s and 60s that are left unmaintained, pavement deteriorates at an accelerated rate. Road treatments for "fair" or "poor" streets are much more expensive, as it is often necessary to repair structural damage or even rebuild the road. The "worst-first" approach to pavement management is costly, time consuming, and disrupts traffic flow for extended periods of time.

The concept of pavement preservation relates to extending a pavement's service life by carefully choosing surface treatments while the pavement is still in good condition. Various strategies for roadway treatment include:

- **Routine Maintenance:**
  Scheduled, day-to-day activities (examples: crack sealing, repairing potholes, patches, maintaining channelization)

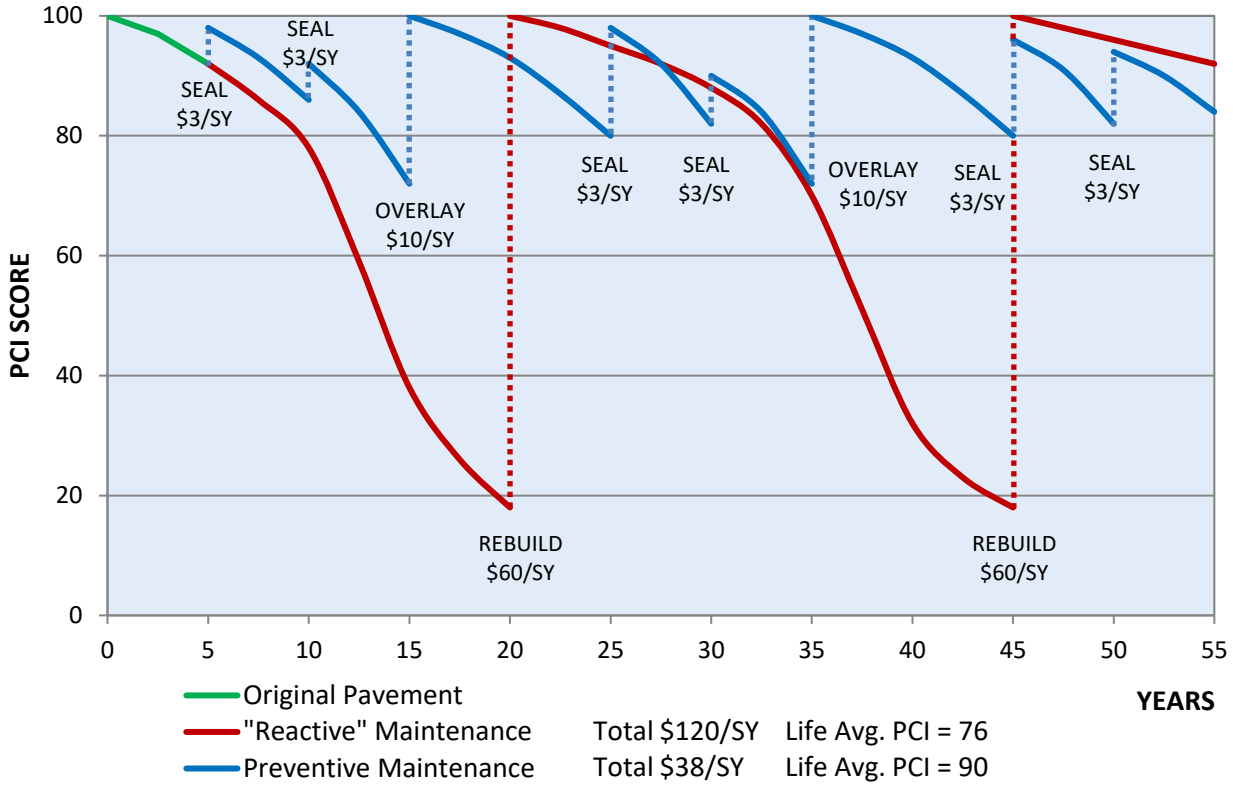
- **Preventive Maintenance:**
  Series of low-cost treatments intended to reduce the rate of road deterioration and preserve the existing road system (examples: seal coats, thin asphalt overlay)

- **Rehabilitation/Reconstruction:**
  Milling or removal of existing pavement, addressing subgrade problems, and constructing new asphalt structures

The success and cost-effectiveness of these treatments depend on choosing the optimal time to apply them, in order to get the greatest improvement possible for the lowest cost. By taking a proactive approach to maintaining our road network, we can provide the public with improved mobility and safer, smoother, longer-lasting pavements – and maximize the return on the City's investment.

Effect of Treatments

Example: cost per square yard for a residential road over 55 years



In the chart above, the red descending curves represent the “reactive” model of pavement treatment, in which roads deteriorate unchecked until they trigger major road rehabilitation. The blue curves illustrate the concept of pavement preservation, in which roads receive preventive maintenance regularly while still in good condition. Although prices for road treatments fluctuate and increase over time, the example serves to illustrate the obvious advantages to applying preventive maintenance.

Counting over the same period of time, the sum of the costs of preventive maintenance is substantially less than road reconstruction. This approach sustains a higher level of pavement performance and delays the need for rehabilitation. Benefits also include improved ride quality and safety, increased customer satisfaction, and reduced traffic congestion associated with major road repair.

Elements of Pavement Preservation

Treatment	Description	Expected Life of Treatment	Advantages	Disadvantages
Crack Seal	Localized treatment preventing water and debris from entering the road base and sub-base	3-5 years	• Low cost • Common, widely used • Effective	• Short life span • Only addresses cracks • Possible reflective cracking later
Slurry Seal or Microsurfacing	Surface treatment of fine aggregate and asphalt emulsion. Makes a cold mixed material that cures quickly to a hard wearing surface	5-8 years	• Waterproofs and protects surface • Reduces pavement oxidation • Slows surface raveling • Adds surface friction • Improves ride and profile	• Cure time dependent on weather conditions • Success dependent on experienced contractor and proper mix of ingredients
Chip Seal	Similar to slurry seal, with larger aggregate placed on top of asphalt binder	7-10 years	• Similar advantages as for slurry seals • More effective at sealing medium-severity cracking than other treatments	• Aggregate can become dislodged • Associated with increased road noise and rougher surface
Cape Seal	Chip seal applied, with layer of slurry seal/ microsurfacing on top	10-15 years	• Smoother ride than chip seal alone • Extended treatment life • Asphalt-like finish at lower cost	• More expensive than other seals
Thin Hot-Mix Asphalt Overlay	Thin layer (up to 1.25”) applied to road surface	10-12 years	• Works well in all climate conditions • Improves ride quality • Corrects surface irregularities	• Provides no additional structural capacity • Subject to delamination and reflective cracking

BUDGET NEEDS CALCULATION ----- ----- ---- ---- ----

In order to run budget scenarios and ultimately develop an effective maintenance and rehabilitation strategy, the *StreetSaver* program first determines the maintenance "needs" of the roadway network. Because it costs less to maintain roads in good condition, *StreetSaver* calculates what it would take to improve the road system overall to an optimal PCI with no backlogged maintenance and then maintain it at that level (upper 80s/lower 90s). In this analysis a budget was calculated for ten years based on current treatment selections and unit costs, using an inflation factor of 3%. For each management section, the program projects the condition with and without treatment, recommends one or more treatments over the analysis period, and estimates treatment costs. The calculation tends to identify funding early for the poorer roads, so the estimated budget varies from year to year. Although greatly exceeding the City's funding levels, the budget needs analysis represents an ideal funding strategy as calculated by *StreetSaver*.

The table below shows the level of expenditures, estimated at about $112.0 million, that is needed to raise the City's pavement condition to a network PCI average of around 90, and maintain that level while eliminating maintenance backlog. Of this amount, nearly $17.9 million was designated for preventive maintenance (life-extending treatments), and about $94.0 million for the more expensive rehabilitation and reconstruction treatments. The analysis also shows that if no road maintenance is applied over the next ten years, the overall PCI score will drop to 65 by 2031.

Year	PCI Treated	PCI Untreated	PM Cost	Rehab Cost	Cost
2022	91	82	$4,444,239	$26,014,058	$30,458,297
2023	89	80	$716,724	$5,141,712	$5,858,436
2024	88	78	$1,141,033	$4,282,250	$5,423,283
2025	87	77	$114,899	$5,173,840	$5,288,739
2026	87	75	$773,107	$5,202,691	$5,975,798
2027	88	73	$6,796,392	$3,422,577	$10,218,969
2028	88	71	$1,536,661	$4,820,900	$6,357,561
2029	88	69	$1,947,736	$11,690,857	$13,638,593
2030	90	67	$278,663	$23,387,471	$23,666,134
2031	88	65	$166,917	$4,911,586	$5,078,503
		% PM	**PM Total Cost**	**Rehab Total Cost**	**Total Cost**
		16.00%	**$17,916,371**	**$94,047,942**	**$111,964,313**

BUDGET SCENARIOS ----- ----- ----- ---- ---- ----

Once maintenance needs are established for the road network, we can run several "what-if" analyses to develop a cost-effective maintenance and rehabilitation strategy. The impact of various budget scenarios can be evaluated by projecting pavement condition values and deferred maintenance over a period of time, and make clear the advantages and disadvantages of different funding levels and maintenance strategies.

For each analysis a portion of the annual budget was allocated to preventive maintenance, such as crack and surface seals. As was the case with the budget needs module, the scenarios take into account current unit costs with inflation and treatment options. Each scenario also forecasts a cost for deferred maintenance based on projected PCI scores. Deferred maintenance refers to pavement rehabilitation that is needed but cannot be performed due to budget limitations. Putting off needed street repairs allows pavement quality to gradually decrease, but it also makes those treatments much more expensive later on, as those street sections fall into the "fair" and "poor" categories. Once deemed in need of reconstruction, the software no longer considers a section for preventive maintenance. Deferred maintenance values relay a general trend and are prone to vary depending on actual maintenance done.

- **Scenario 1: Unfunded (No Budget)**
  The first scenario predicts the impact on pavement condition if no funding is put toward roadway projects for the next ten years. The network PCI value is estimated to drop from 83.3 to 65.

- **Scenario 2: $2.0 Million Annual Budget**
  The City of Lacey recently formed a Transportation Benefit District (TBD) and proposed a 0.2% increase in sales tax in order to fund street maintenance. In July of 2017, the City began collecting revenues generated by this measure. Based on early returns, the annual income is estimated at $2.0 million through the year 2031. The PCI drops to 72 over the duration of the ten-year analysis period.

- **Scenario 3: Maintain Current PCI ($7.0 million/year)**
  In this target-driven scenario, *StreetSaver* calculated what it would cost to sustain the current PCI of 83.3 during a ten-year period. The total cost came to about $69.7 million, an average of roughly $7.0 million each year.

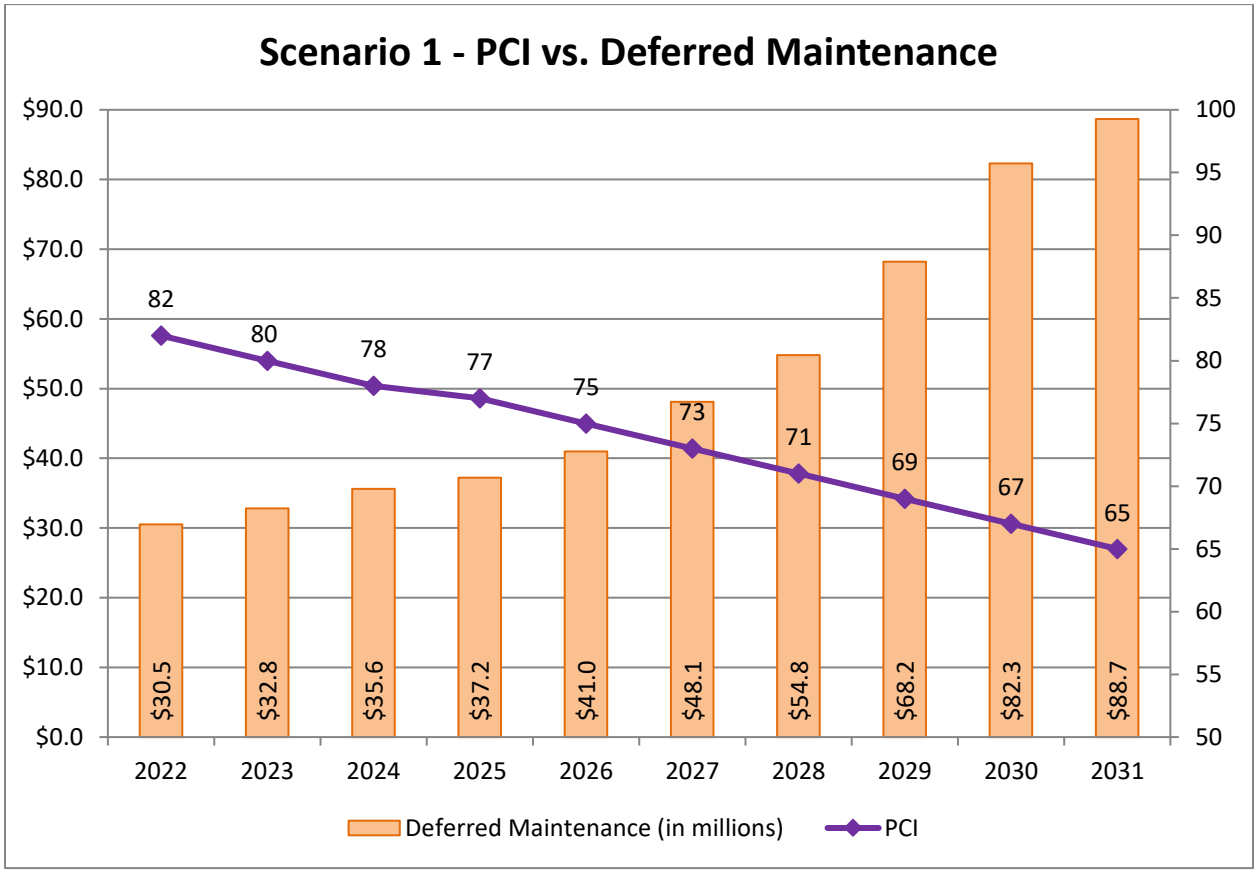
- **Scenario 4: Unconstrained Budget (Approx. $11.2million/year)**
  The "budget needs" study (see page 11) calculated that it would take $112.0 million to immediately raise the network pavement condition to an ideal level and sustain that level for nine additional years. The amount per year varied depending on the maintenance backlog, but equated to roughly $11.2 million annually. The PCI score would increase from 83.7 to 88 in the 10 year period.

Scenario 1: Unfunded (No Budget)

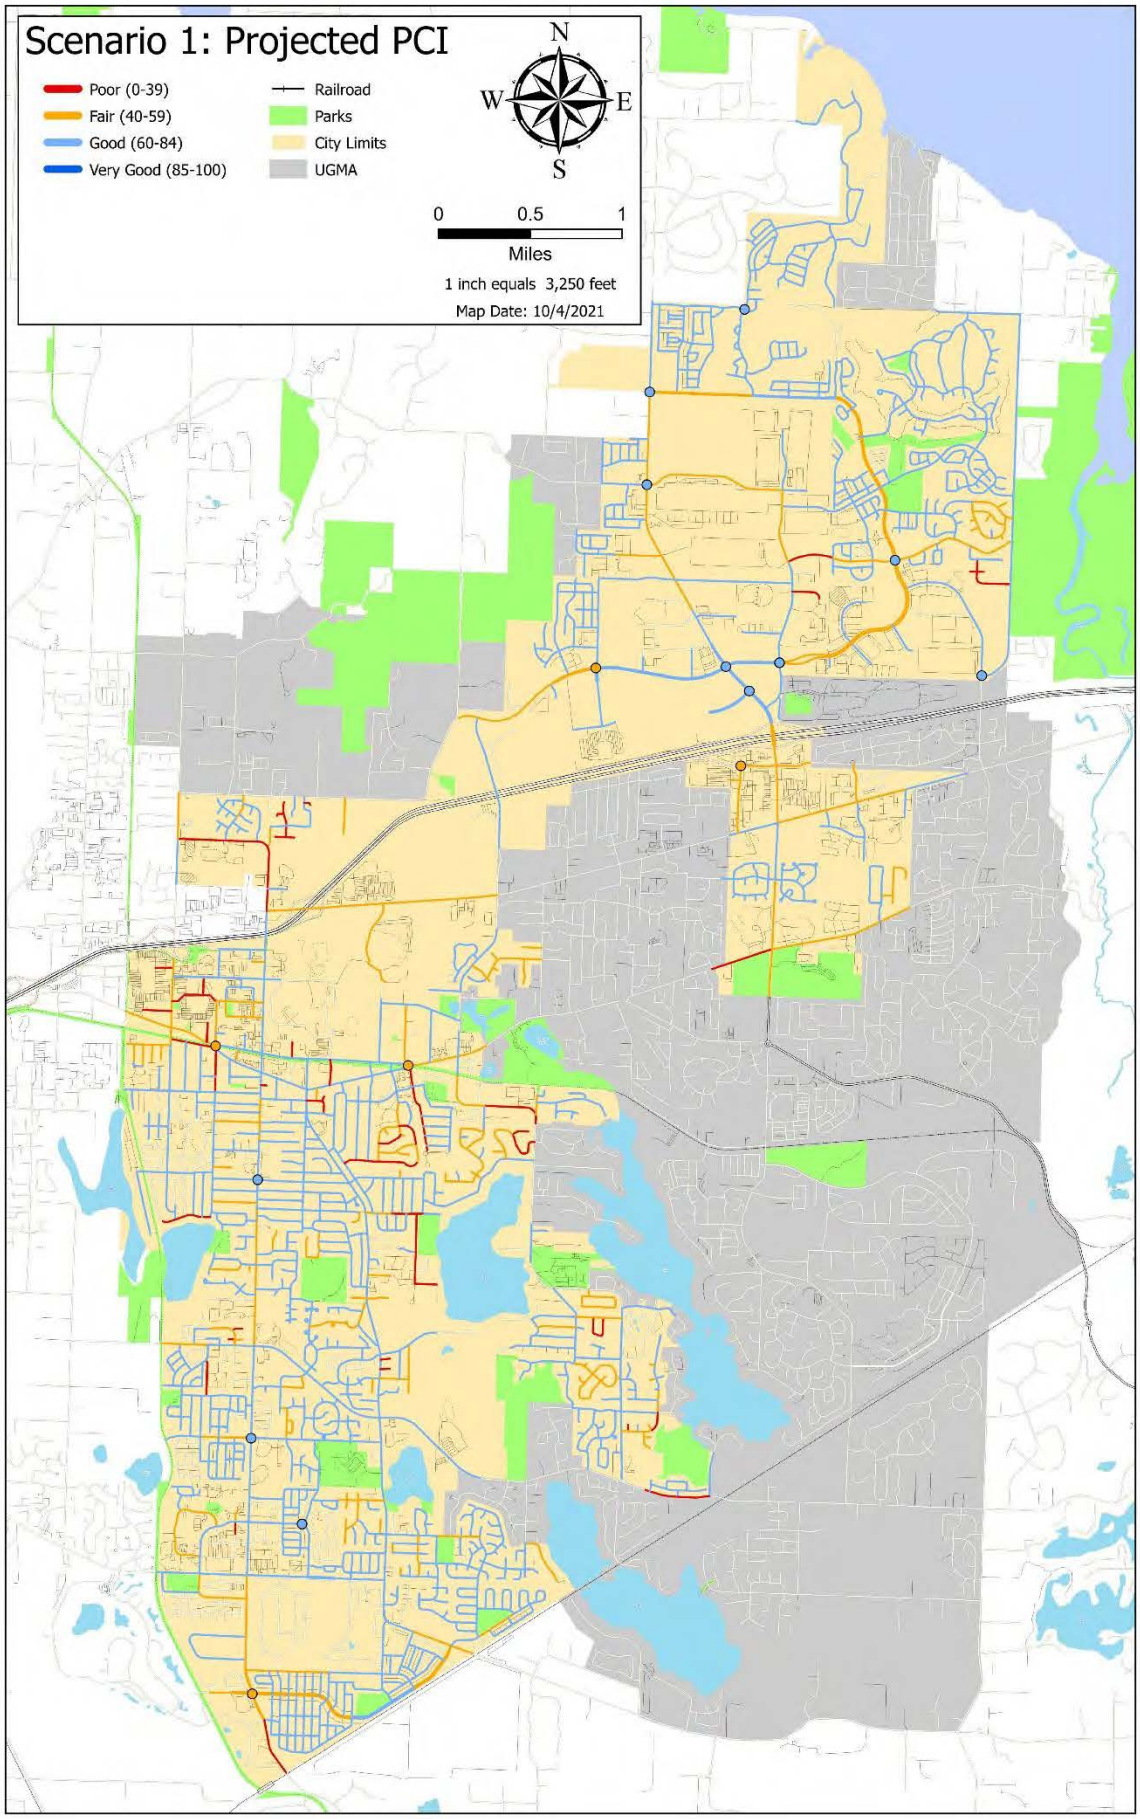
In the first scenario, no funds are set aside for pavement preservation. The network PCI is estimated to decrease to 65 from the current value of 83.3. By the year 2031, no streets would be in the "very good" category, and categories "fair" and "poor" would make up 21.9% of all streets. Deferred maintenance is estimated to increase to nearly $89 million.

Summary from Scenario 1: Unfunded

Year	PCI	Deferred Maintenance
2022	82	$29,326,989
2031	65	$88,654,527



Return to Agenda

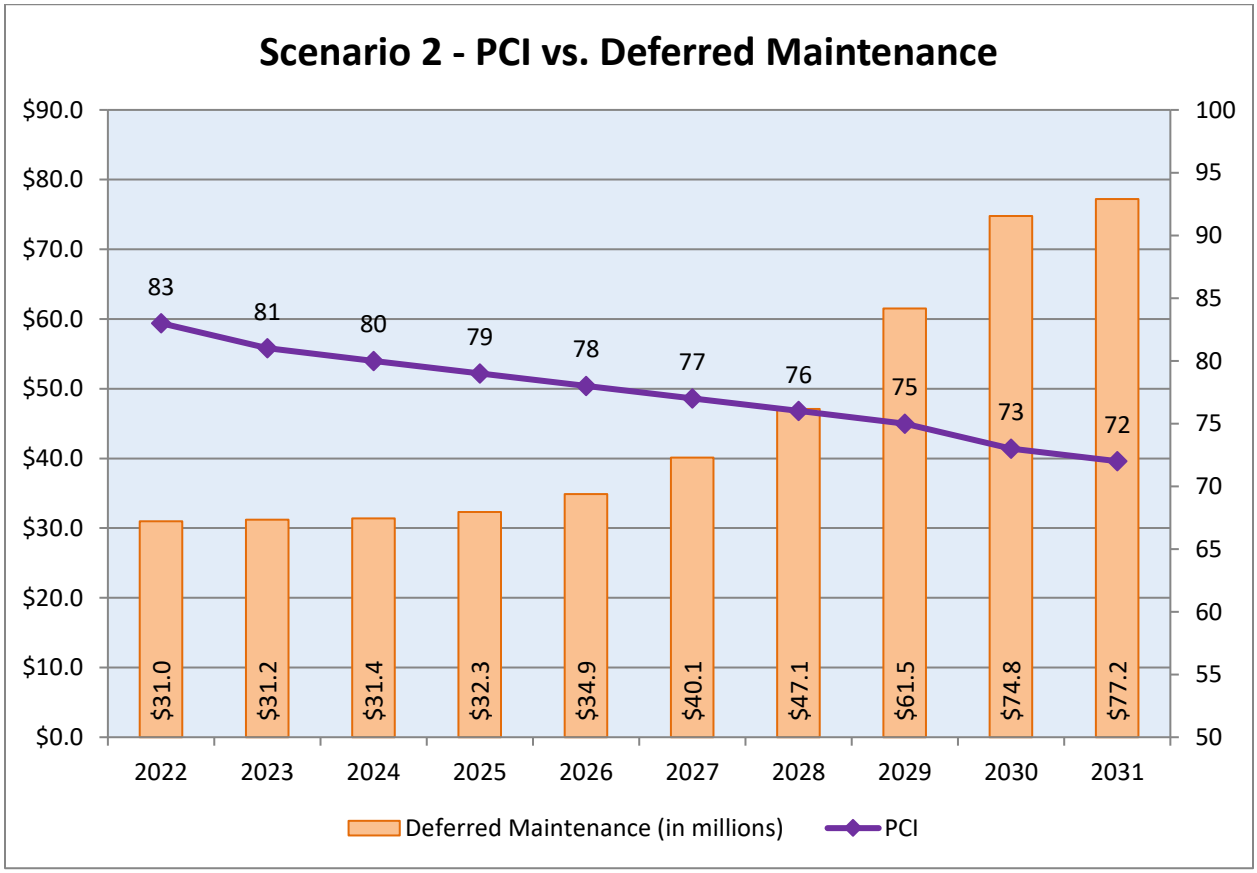


Scenario 2: $2.0 Million Annual Budget

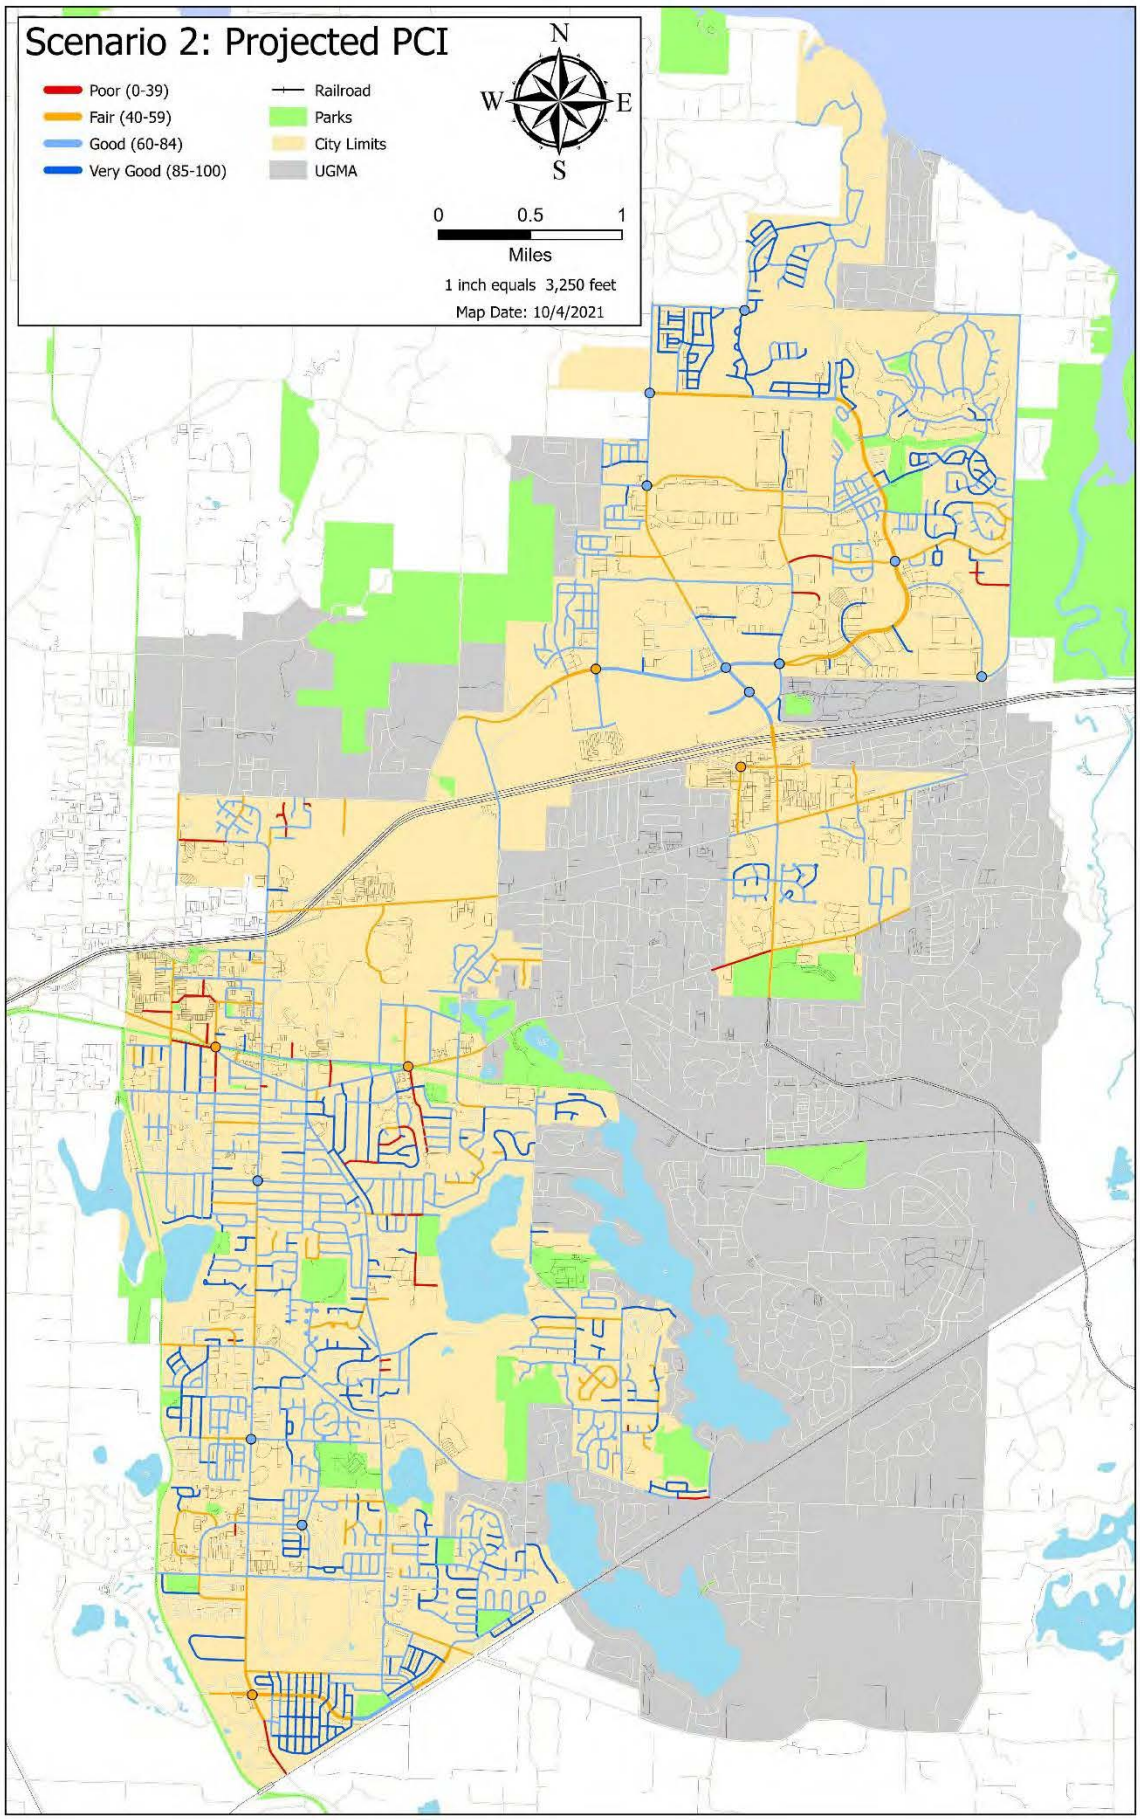
This scenario shows the effects of an annual $2.0 million budget strategy toward the City's road network, beginning in 2022 and ending in 2031. The overall PCI score would steadily decrease from 83.3 to 72 by 2031. The cost of deferred maintenance would go up from $31.0 million in 2022 to $77.2 million in 2031, as an increasing number of streets would require reconstruction. At this investment level, in ten years' time 11.3% of the network would be in the "fair" category and 2.9% in the "poor" category.

Summary from Scenario 2:
$2.0 Million Annual Budget

Year	PCI	Deferred Maintenance
2022	83	$31,034,724
2031	72	$77,172,111



Return to Agenda

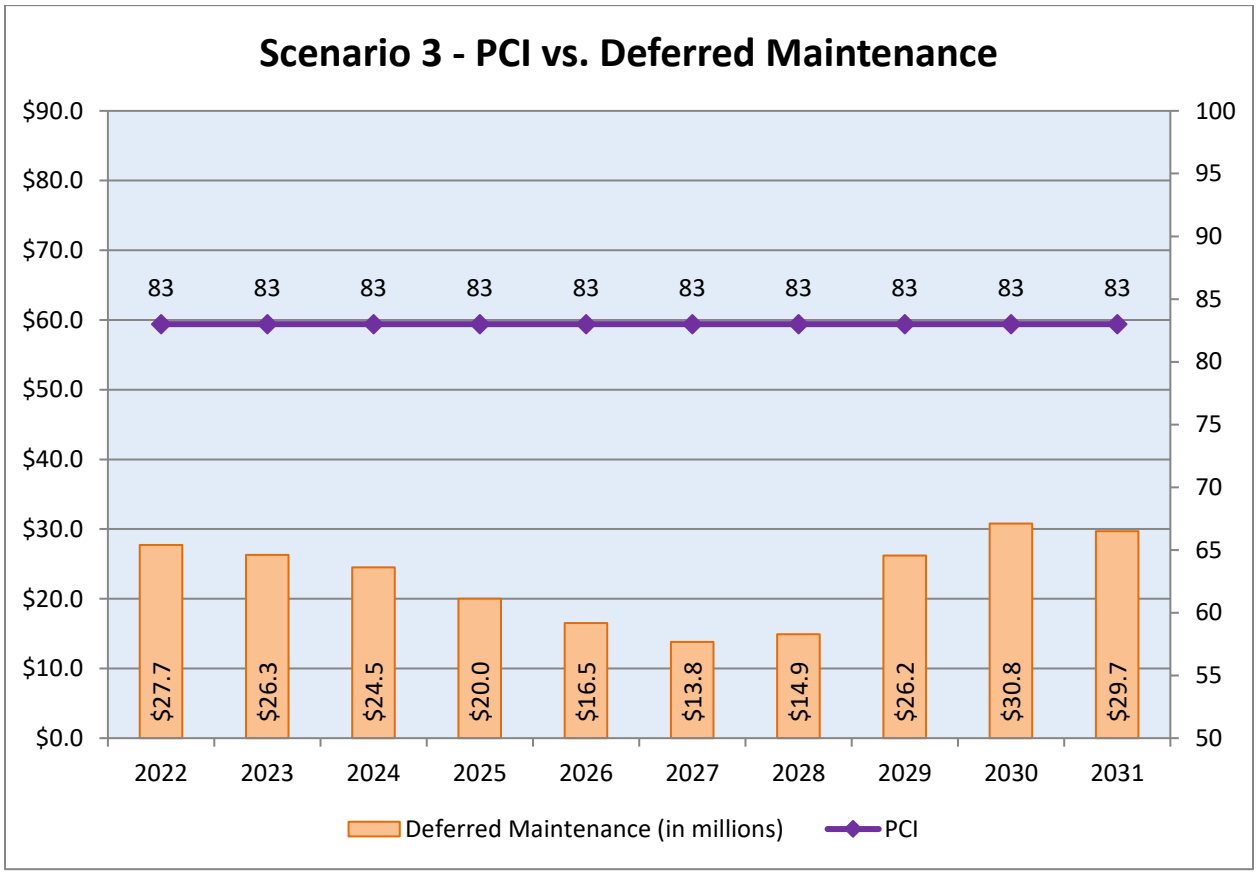


Scenario 3: Maintain Current PCI

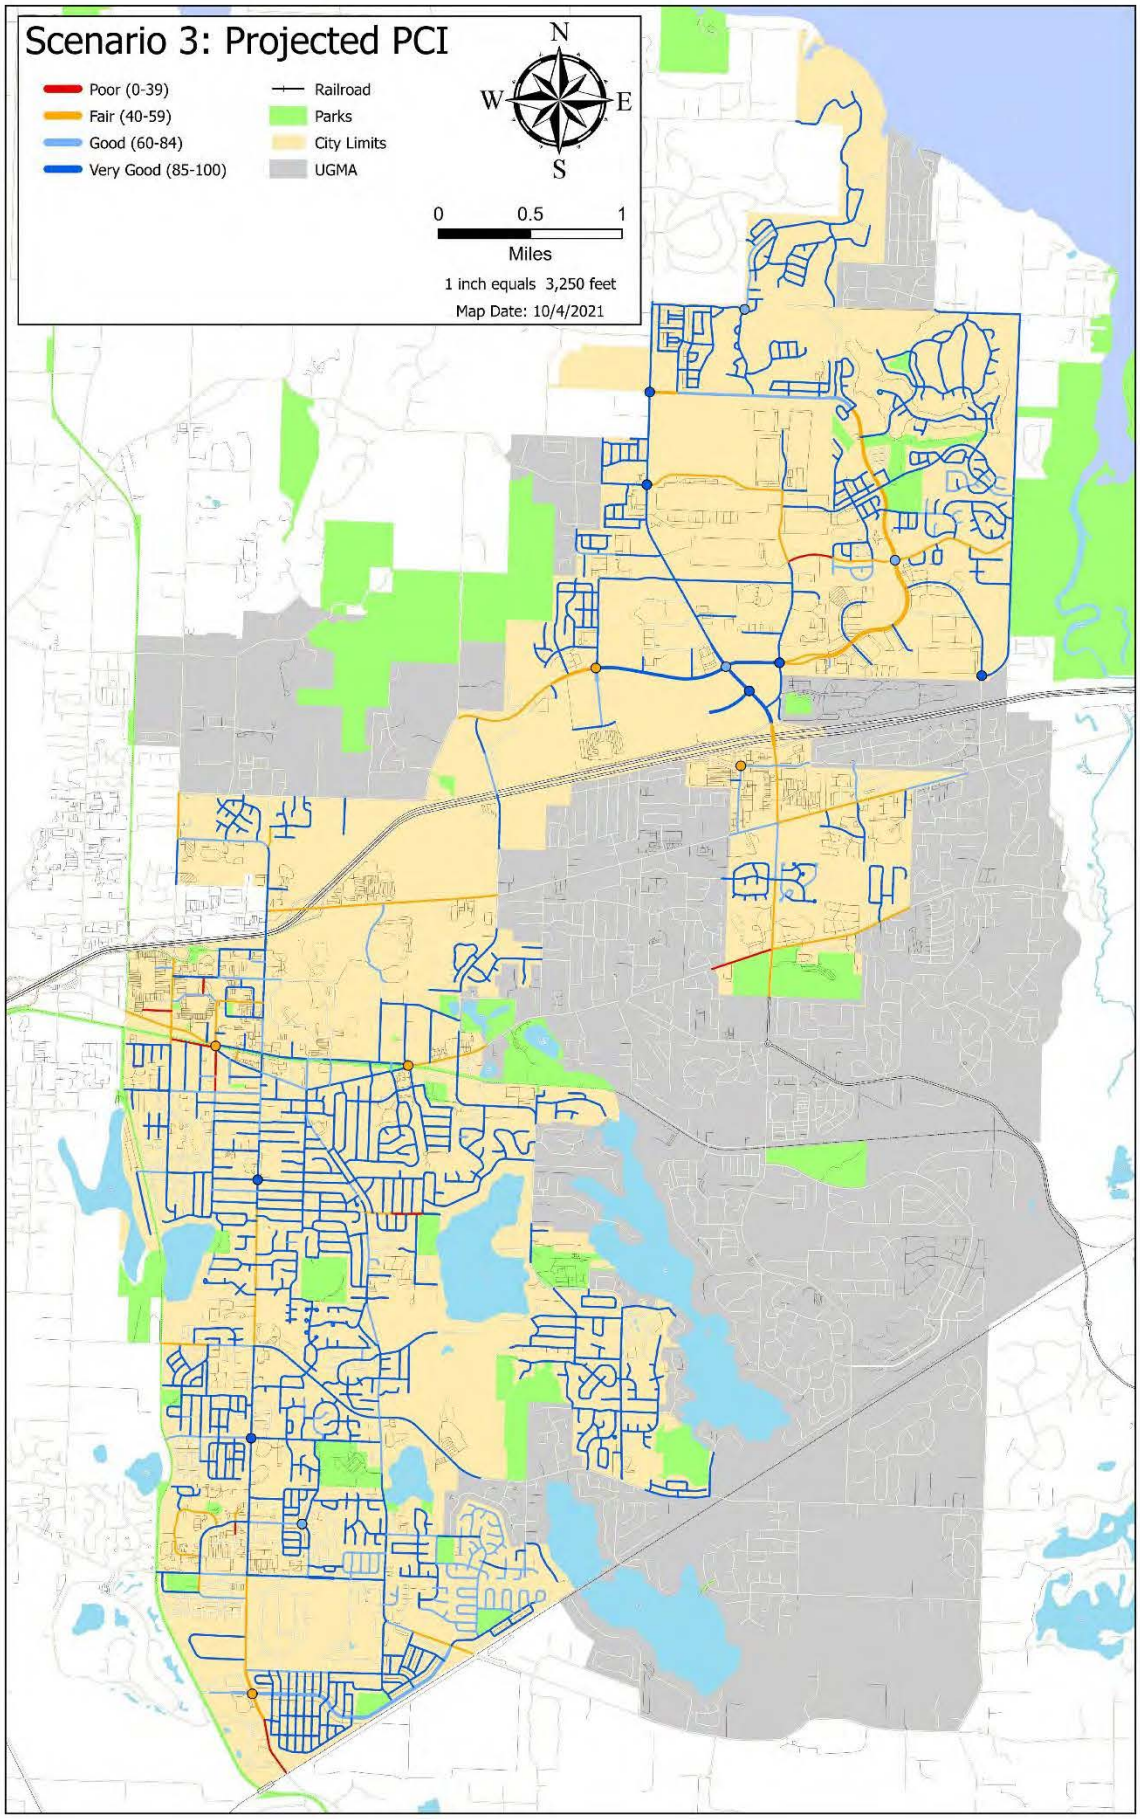
This scenario shows what it would take to maintain the current PCI of 83.3 over a ten-year period. The *StreetSaver* program calculates an amount of $7.0 million per year to reach this goal. The cost of deferred maintenance would increase from $27.7 million to $29.7 million. 93.8% of the network would be classified as Good or Very Good under this investment schedule. Only 0.8% of the network would fall under the Poor category.

Summary from Scenario 3: Maintain Current PCI

Year	PCI	Deferred Maintenance
2022	83	$27,651,504
2031	83	$29,679,308



Return to Agenda



Scenario 4: Unconstrained Budget

In this scenario, an unconstrained amount is applied in 2022 to bring the network PCI to the Budget Needs condition of 90. Each successive year, an amount is placed towards preventative maintenance based on demand of the StreetSaver algorithm. Approximately $112.0 million would be spent over the 10 year period averaging to roughly $11.2 million annually. By the year 2031, about 67.3% of the network would be in the "very good" category and the remaining 32.7% in the "good" category. Deferred maintenance would be eliminated after year one of this scenario based on each road being constantly maintained to stay above the StreetSaver threshold for reconstruction in the 10 year window and the unconstrained budget able to exceed the yearly recommendations for preventative maintenance and rehabilitation.

Summary from Scenario 4: Unconstrained Budget

Year	PCI	Deferred Maintenance
2022	90	$5,915,646
2031	87	$0

2021 ROADWAY IMPROVEMENTS ----- ---- ---- ----

2021 Overlay (Marvin Rd., Willamette Dr. & Orion Dr.)

The 2021 Overlay Project composed of three roadways.

- Reconstruction of 0.56 lane miles of Marvin Road NE between the Main Street NE and Britton Parkway NE Roundabouts with 6” of fiber reinforced HMA.
- Reconstruction of 1.11 lane miles of Willamette Drive NE between the Marvin Road NE and Hogum Bay Road NE Roundabouts with 6” of fiber reinforced HMA.
- Reconstruction of 1.27 lane miles of Orion Drive NE between Willamette Drive NE and where the 2021 Overlay limits terminated north of the Meridian Road NE Roundabout with 6” of fiber reinforced HMA.

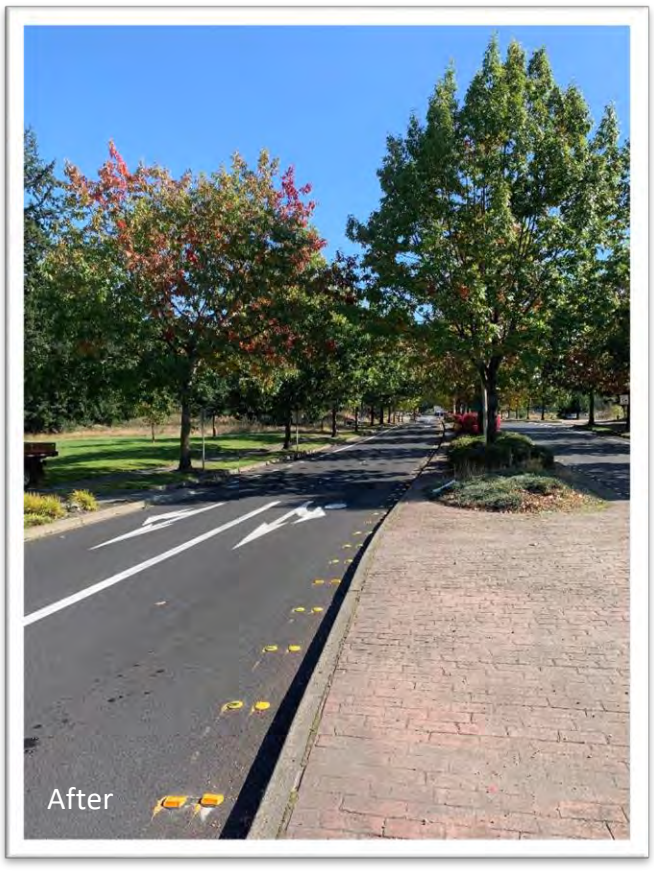
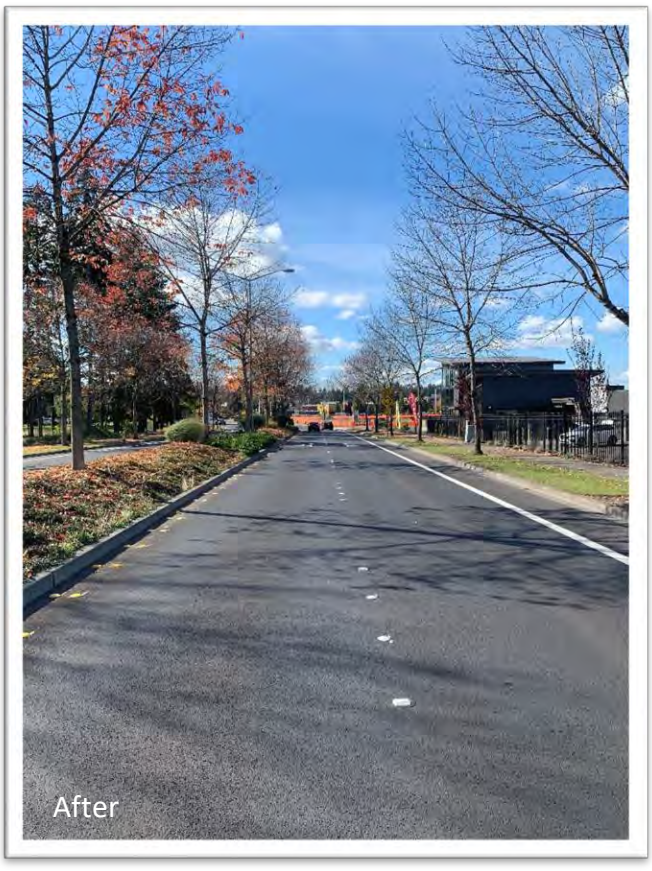
Marvin Rd NE



Willamette Dr NE



Return to Agenda

Orion Dr NE

Carpenter Rd. Overlay

The Carpenter Rd. Overlay Project composed of two roadways.

- Reconstruction of 3.70 lane miles of Carpenter Road SE with 6" of fiber reinforced HMA between the Thurston County Mullen Roundabout project northern limits and the city limit north of 26th Court SE. A portion of the project (Approx. 1.31 lane miles) are located in Thurston County.

- Reconstruction of 0.09 lane miles of 45th Avenue SE with 4" HMA adjacent to Carpenter Road SE.

PAVEMENT CONDITION INDEX SCORES ----- ---- ---- ----

Pavement Condition Index (PCI):
A value between 0 and 100 which is used to indicate the general condition of a pavement. This table shows PCI scores from the past five years for each road segment.

Remaining Service Life (RSL):
The estimated number of years to the time when the pavement is providing substandard service quality.

ROADWAY DEFECT DEFINITIONS ----- ---- ---- ----

The *Pavement Surface Condition Field Rating Manual for Asphalt Pavement* is the guide used to determine pavement defects and the severity of those defects. Written by the Northwest Pavement Management Association (NWPMA) and the Washington State Department of Transportation (WSDOT), the rating manual defines fourteen different types of defects with three levels of severity.

In Lacey's pavement management system, information is collected for the following defects:

- Rutting & Wear
- Alligator Cracking
- Longitudinal & Transverse Cracking
- Raveling & Weathering
- Patching
- Depressions & Distortions

Rutting & Wear

Rutting is a surface depression within the wheel path may be caused by heavy trucks, slow or stopping traffic, poor construction or moisture damage. When the upper pavement layers are rutted, the pavement along the edges of the rutted area may lift up.

Wear is surface depression in the wheel path resulting from tire abrasion.

Rating Severity:

In both cases, the overall severity is measured by the average observed depth of the rut, or wear depression.

Low	1/4 inch to 1/2 inch
Medium	1/2 inch to 3/4 inch
High	over 3/4 inch

Alligator Cracking

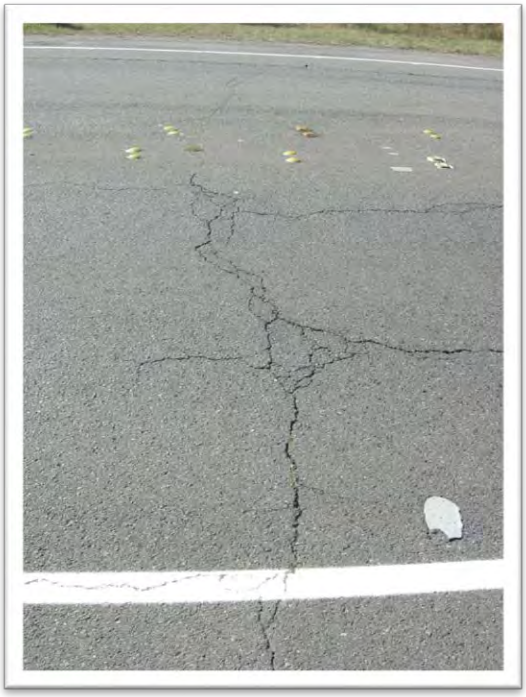
Alligator Cracking is associated with loads and is usually limited to areas of repeated traffic loading. Generally, cracking of this type begins as a single longitudinal, discontinuous crack within the wheel path that progresses with time and loads to a more branched pattern that begin to interconnect. Eventually the cracks interconnect sufficiently to form many pieces, resembling the pattern of alligator hide.

Potholes and other occurrences of missing or destroyed pavement eventually accumulate as crack severity worsens.

Rating Severity:

Low	Branched, discontinuous thin cracks are beginning to interconnect and form the typical alligator pattern.
Medium	Cracking is interconnected and forms an alligator pattern. The cracks are wider with some spalling* along the edges, but the pavement pieces are still in place.
High	The alligator pattern is fully developed. Individual pieces of pavement may be loosened or even missing. Pumping* up through the cracks may be seen.

* See Glossary (pages 102-103)



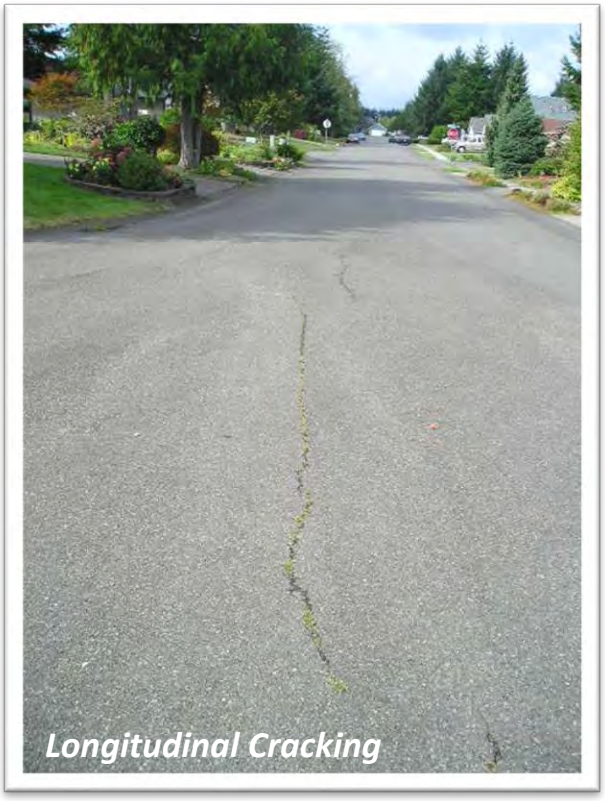
Longitudinal & Transverse Cracking

Longitudinal Cracks run roughly parallel to the roadway center line. Longitudinal cracks associated with the beginning of alligator cracking are generally discontinuous and broken. They may be associated with loads, poorly constructed paving joints, or joints and cracks under the surface course.

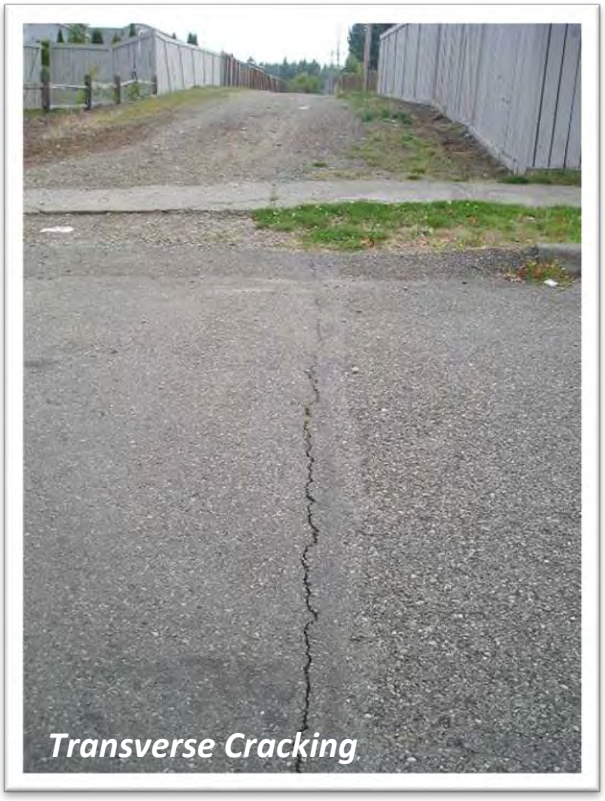
Transverse Cracks run roughly perpendicular to the roadway center line. They may be due to surface shrinkage caused by low temperatures, hardening of the asphalt, or cracks in underlying pavement layers.

Rating Severity:

Low	The cracks have very little or no spalling along the edges and are less than 1/4 inch wide ("hairline" cracks).
Medium	Cracking is 1/4 inch wide or greater. There may be a few thin connecting or intersecting cracks near the main crack.
High	Cracks are spalled and wide. Pieces are visibly missing along the crack.



Longitudinal Cracking



Transverse Cracking

Weathering

Weathering is the wearing away of the asphalt binder and fine aggregate. Pavement surface deterioration occurs due to oxidation, inadequate compaction, insufficient asphalt content, excessive natural sand, surface water erosion, and traffic. The pavement loses its smooth surface and begins to appear open and rough like very coarse sandpaper.

Rating Severity:

Low	The asphalt surface is beginning to show signs of aging. The binder or fine aggregate is starting to wear away and may be accompanied by fading of the asphalt color.
Medium	The loss of fine aggregate is noticeable and the edges of the coarse aggregate are exposed up to 1/4 width (of the longest side). The surface texture is moderately rough and pitted.
High	There is considerable loss of fine aggregate and the edges of the coarse aggregate are exposed greater than 1/4 width (of the longest side). The surface texture is very rough and deeply pitted.

Raveling

Raveling is the dislodging of coarse aggregate and it is caused by insufficient asphalt binder, poor mixture quality, inadequate compaction, segregation, or stripping. The pavement surface is rough and appears dimpled and pitted.

Rating Severity:

Medium	The loss of coarse aggregate is considerable (greater than 20 pieces or clusters per square yard).
High	The surface texture is very rough and pitted and may be completely removed in places.

Patching

A patch is an area of pavement which has been replaced with new material to repair the existing pavement or access utilities. Though they are a necessary part of repair work, patched areas generally don't perform as well as the original pavement section.

In general, patches are smaller than typical rehabilitation in size and scope. They are less than full roadway width and/or are less than project length. For each treatment it must be determined whether it would be more effective (and cost-effective) to apply patches throughout as needed, or to simply reconstruct the road.

Rating Severity:

Low	Patch has at most low severity distress of any type.
Medium	Patch has medium severity distress of any type.
High	Patch has high severity distress of any type.

Depressions & Distortions

These defects are localized low spots or elevated areas of the pavement that result from settlement, pavement shoving, displacement due to subgrade swelling, or displacement due to tree roots. These forms of surface distress occur in isolated areas of the road.

Rating Severity:

The severity is defined by as the maximum vertical deviation from a 10-foot straightedge placed on the pavement:

Low	1/8 inch to 2 inches per 10 feet.
Medium	2 inches to 4 inches per 10 feet.
High	Over 4 inches per 10 feet.

Distortion (tree roots)

Depression

GLOSSARY OF COMMON TERMS ----- ---- ---- ----

Arterial — High-volume roadway intended for efficient movement of people and goods.

Collector — Roadway that connects commercial, industrial and residential streets to arterials or other collectors.

Distresses/ Defects — Visual pavement surface distress or pavement defects can be quantified and related to the life cycle of a given type of pavement or roadway under given traffic and weather conditions. Each distress is generally associated with a specific pavement property, such as aging, wearing, fatigue, or materials. These pavement surface defects can be distinguished and quantified visually by human or automated techniques.

Extent — Extent is the measure of area, length, or count associated with a given distress. It is how much and how far a given defect has progressed.

HMA — Hot Mix Asphalt. The most common type of flexible pavement surfacing in the U.S.

PCI — Pavement Condition Index. A value from 0 to 100 assigned to a given road section, calculated by deducting points for the extent and severity of noted defects. Serves as a comparative indicator of pavement condition.

PMS — Pavement Management System. "A systematic method for routinely collecting, storing, and retrieving the kind of decision-making information needed [about pavements] to make maximum use of limited maintenance [and construction] dollars." - The American Public Works Association (APWA)

Pavement Preservation — "The timely application of carefully selected surface treatments to maintain or extend a pavement's effective service life."

Project — A project is the unit used to evaluate or group pavement elements. Projects are generally thought of as portions of roadway that could reasonably become funded improvement projects; however, they can be grouped together for various reasons. They generally consist of similar geometric data, such as pavement width, structure, and pavement type, or can be related to other needs, such as traffic volumes or planning needs.

Pumping The forcing of base materials up through the cracks in the pavement by water.

Raveling The loss of material from the pavement. This may involve only small amounts of fine aggregate and/or binder; or it may involve large pieces of the pavement at the edge of cracks or joints.

RSL The Remaining Service Life of a pavement is the estimated number of years to the time when the pavement is providing substandard service quality. This value is calculated using the distress data and the pavement's rate of deterioration.

Severity The definition of severity for a given defect varies with each distress and is generally a measure of how badly or to what extent a given defect has deteriorated. Examples are crack widths, crack deterioration, or spalling, and loss of materials.

Spalling The deterioration of the sharp edge formed at the pavement surface along each side of a crack or joint. With severe spalling, pieces of the pavement break away, causing the visual size or width of the crack on the pavement surface to be irregular and wider than the crack width below the surface. Large spalls may extend to full depth.

Segment A segment is generally a single block, 1/10th mile, or other relatively short, homogeneous unit of roadway. Several segments may be included in a single project. Smaller segment definitions provide greater flexibility in the growth and expansion of the pavement management system.

These are generally the fundamental elements of the roadway network and thus the PMS database structure. All ratings are performed within each segment. All data within the PMS are linked or referenced to a given segment, and they are located in the segment or roadway by the distance or mile post along a given street or road.

Wheel Path There are two wheel paths per traffic lane. If the lane is equally divided longitudinally down the middle, each half may be broadly considered one wheel path. Therefore, a two-lane roadway has four wheel paths.
